

# Smart Grocery

# List Generator

PRESENTED BY

# Shubham Sourava Sahoc VSSUT, Burla

# Challenges of Manual Grocery Lists

- Manual meal planning is chaotic and time-consuming.
- "I want to cook Italian this week" is a vague goal that doesn't translate easily into a shopping checklist.
- Vague planning leads to multiple store trips and food waste.

## The Objective:

- Build a Smart Grocery Assistant that bridges the gap between meal ideas and shopping carts.
- Leverage Generative AI to understand context (e.g., serving sizes, cuisines) and output structured data.
- Demonstrate the capability of running Large Language Models (LLMs) on consumer hardware for privacy and zero cloud costs.

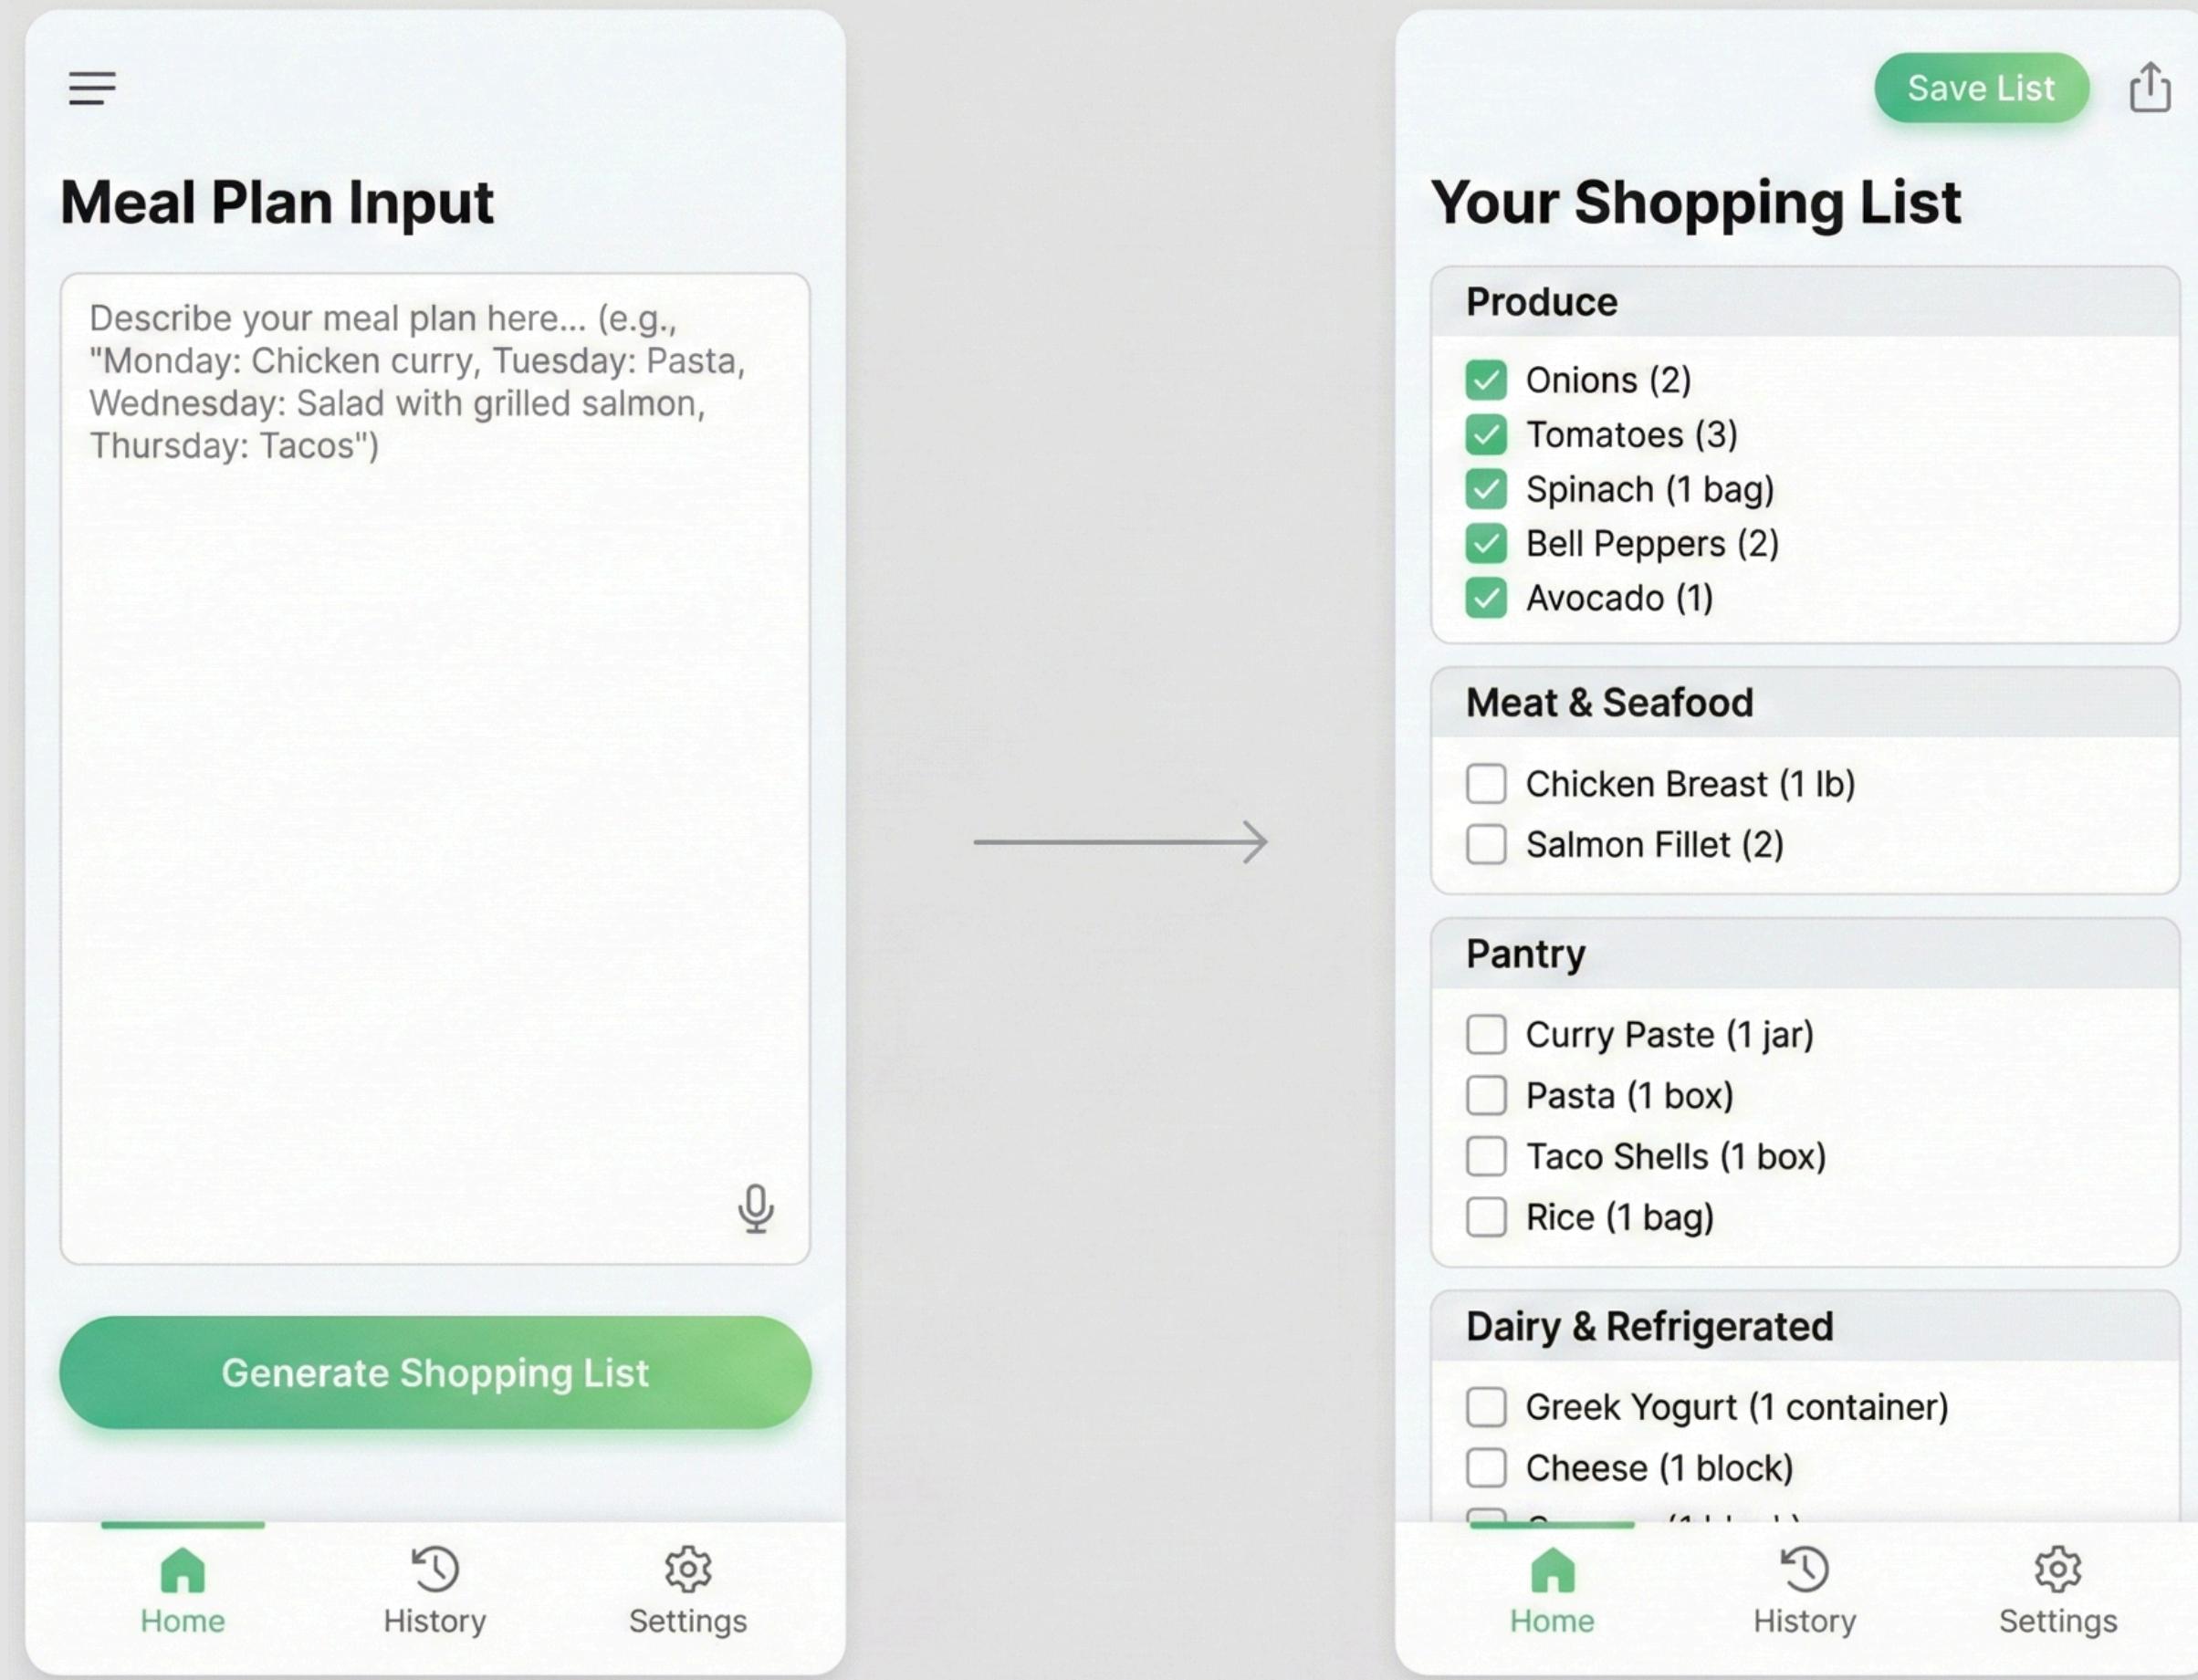

# Proposed Solution

A desktop-based application where users simply describe their meal plan in natural language, and the system instantly generates a categorized shopping list.

## How it Works:

- Input: User types: "Pasta Alfredo for 2 and a Caesar Salad".
- AI Processing: The model identifies the recipes, extracts ingredients, and estimates quantities.
- Output: A structured table (Item | Category | Quantity) ready for export.

# System Architecture

## The Workflow:

1. User Input: Captures meal name & servings.
2. Prompt Engineering: Formats text with specific instructions to ensure strict data output.
3. Local Inference: Mistral-7B (Quantized) processes the request locally.
4. Parsing Logic: Python cleans and structures the raw AI text.
5. Final Output: Generates CSV file.

## Meal Planning Process

### User Inputs Meal Name

The user enters “Pancakes” into the system.

### Mistral-7B Processes Prompt

The AI analyzes the formatted input.

### Final CSV List Generated

The system creates a CSV file with the meal list.

### Prompt Engineering Formats Text

The system structures the input for the AI.

### Parsing Logic Cleans Output

The system refines the AI's output.

# Technology Stack

- Core Language: Python 3.10
- Interface: Streamlit
- AI Model: Mistral-7B-Instruct-v0.2 (Quantized GGUF)
- Inference: Llama.cpp
- Data: Pandas

# Implementation Logic

1. Few-Shot Prompting: We give the AI examples to force strict formatting.
2. Robust Parsing: Python logic cleans the AI output to prevent errors.
3. Quantization: Using 4-bit models allows a 7-Billion parameter brain to run on a standard laptop.
4. Note on Trade-offs: We used 4-bit Quantization (Q4\_K\_M) to compress the model. While this allows local execution, a production version would utilize a REST API architecture. This would offload the computational load to a remote server, significantly improving start-up time and battery efficiency for the end user.

# Key Features of Our Solution

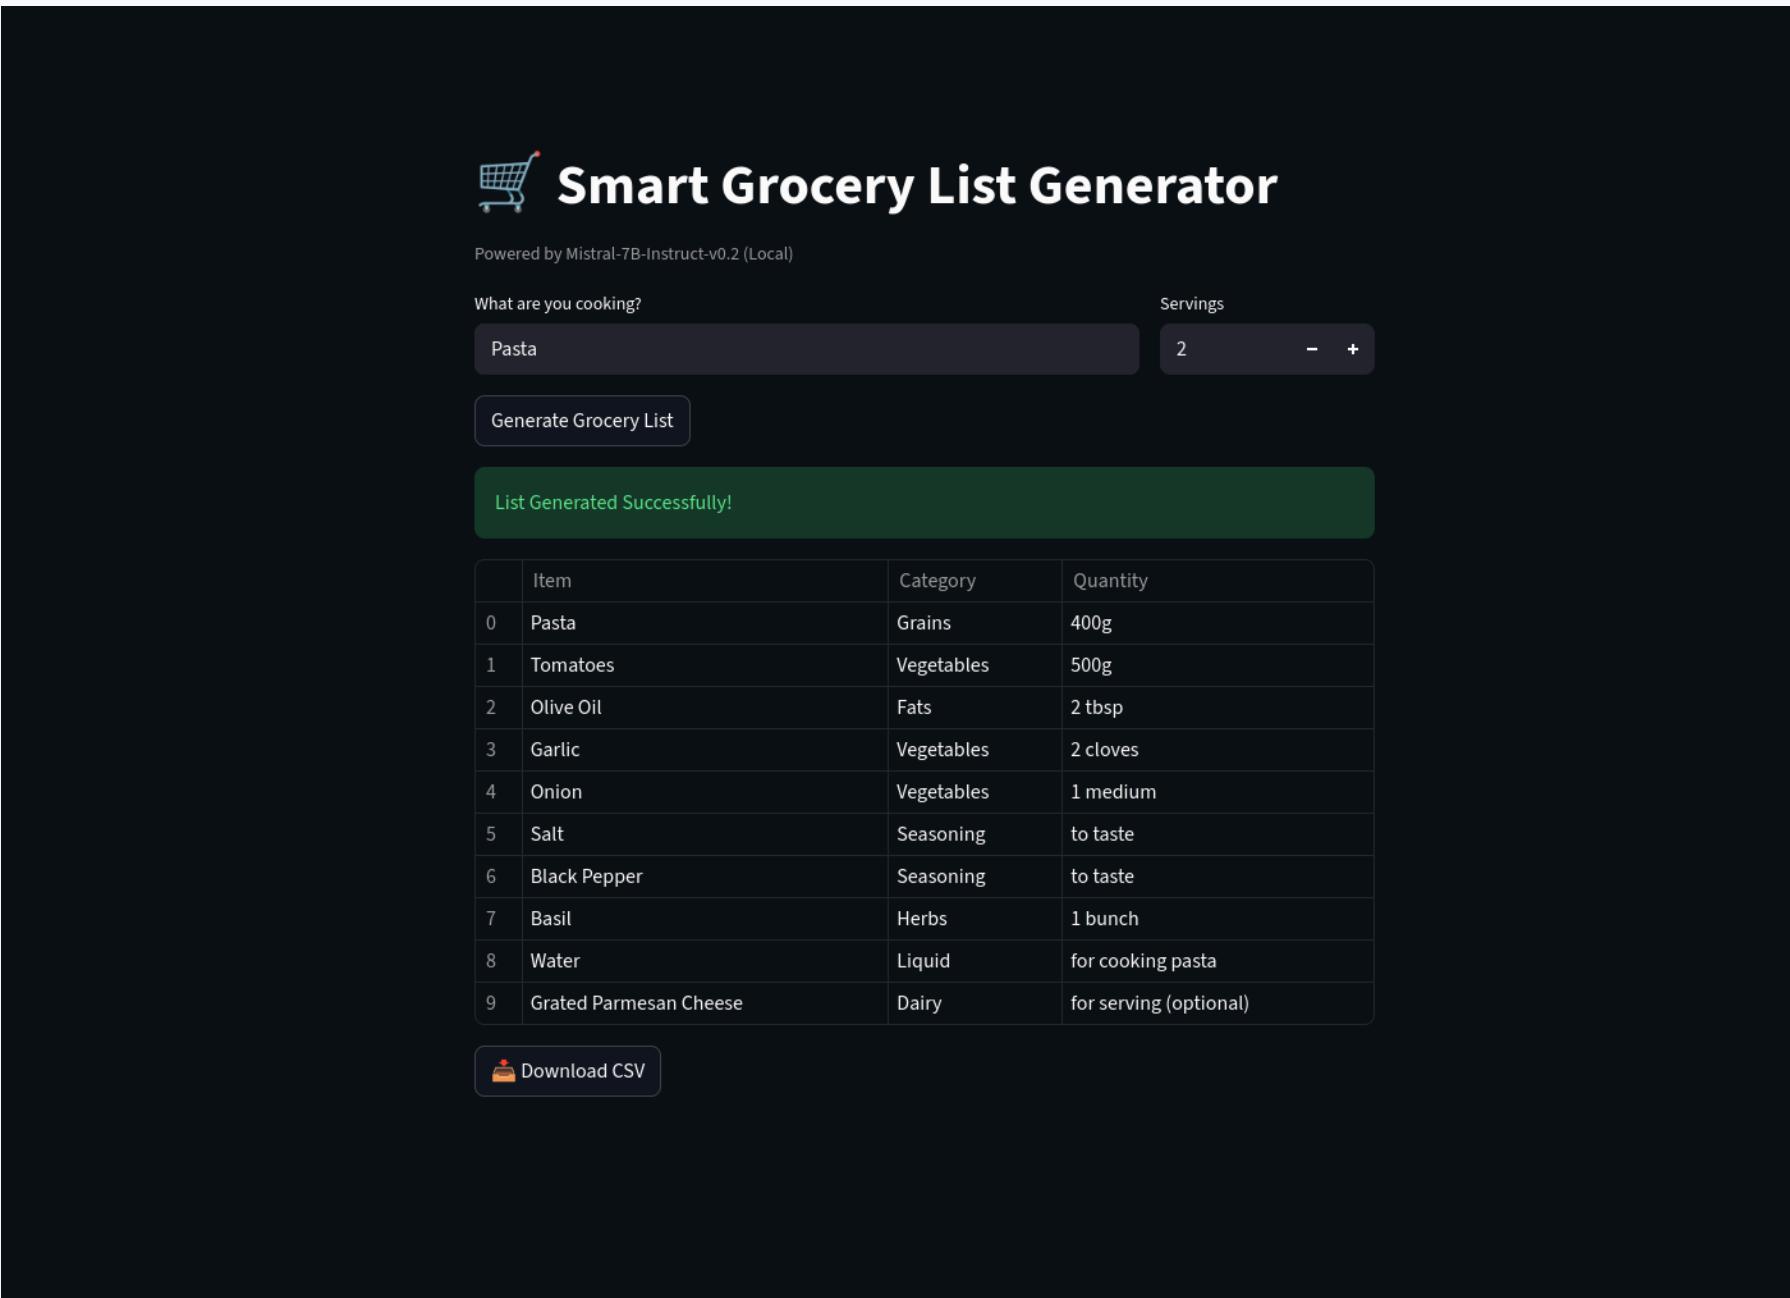

- Privacy-First Prototype: Demonstrates secure, local-only processing where no user data leaves the device.
- Zero-Cost Development: Utilizes open-source quantized models to avoid paid API subscriptions during the prototyping phase.
- Structured Output: Enforces strict CSV formatting (Item | Category | Quantity) from unstructured natural language.

# Project Results

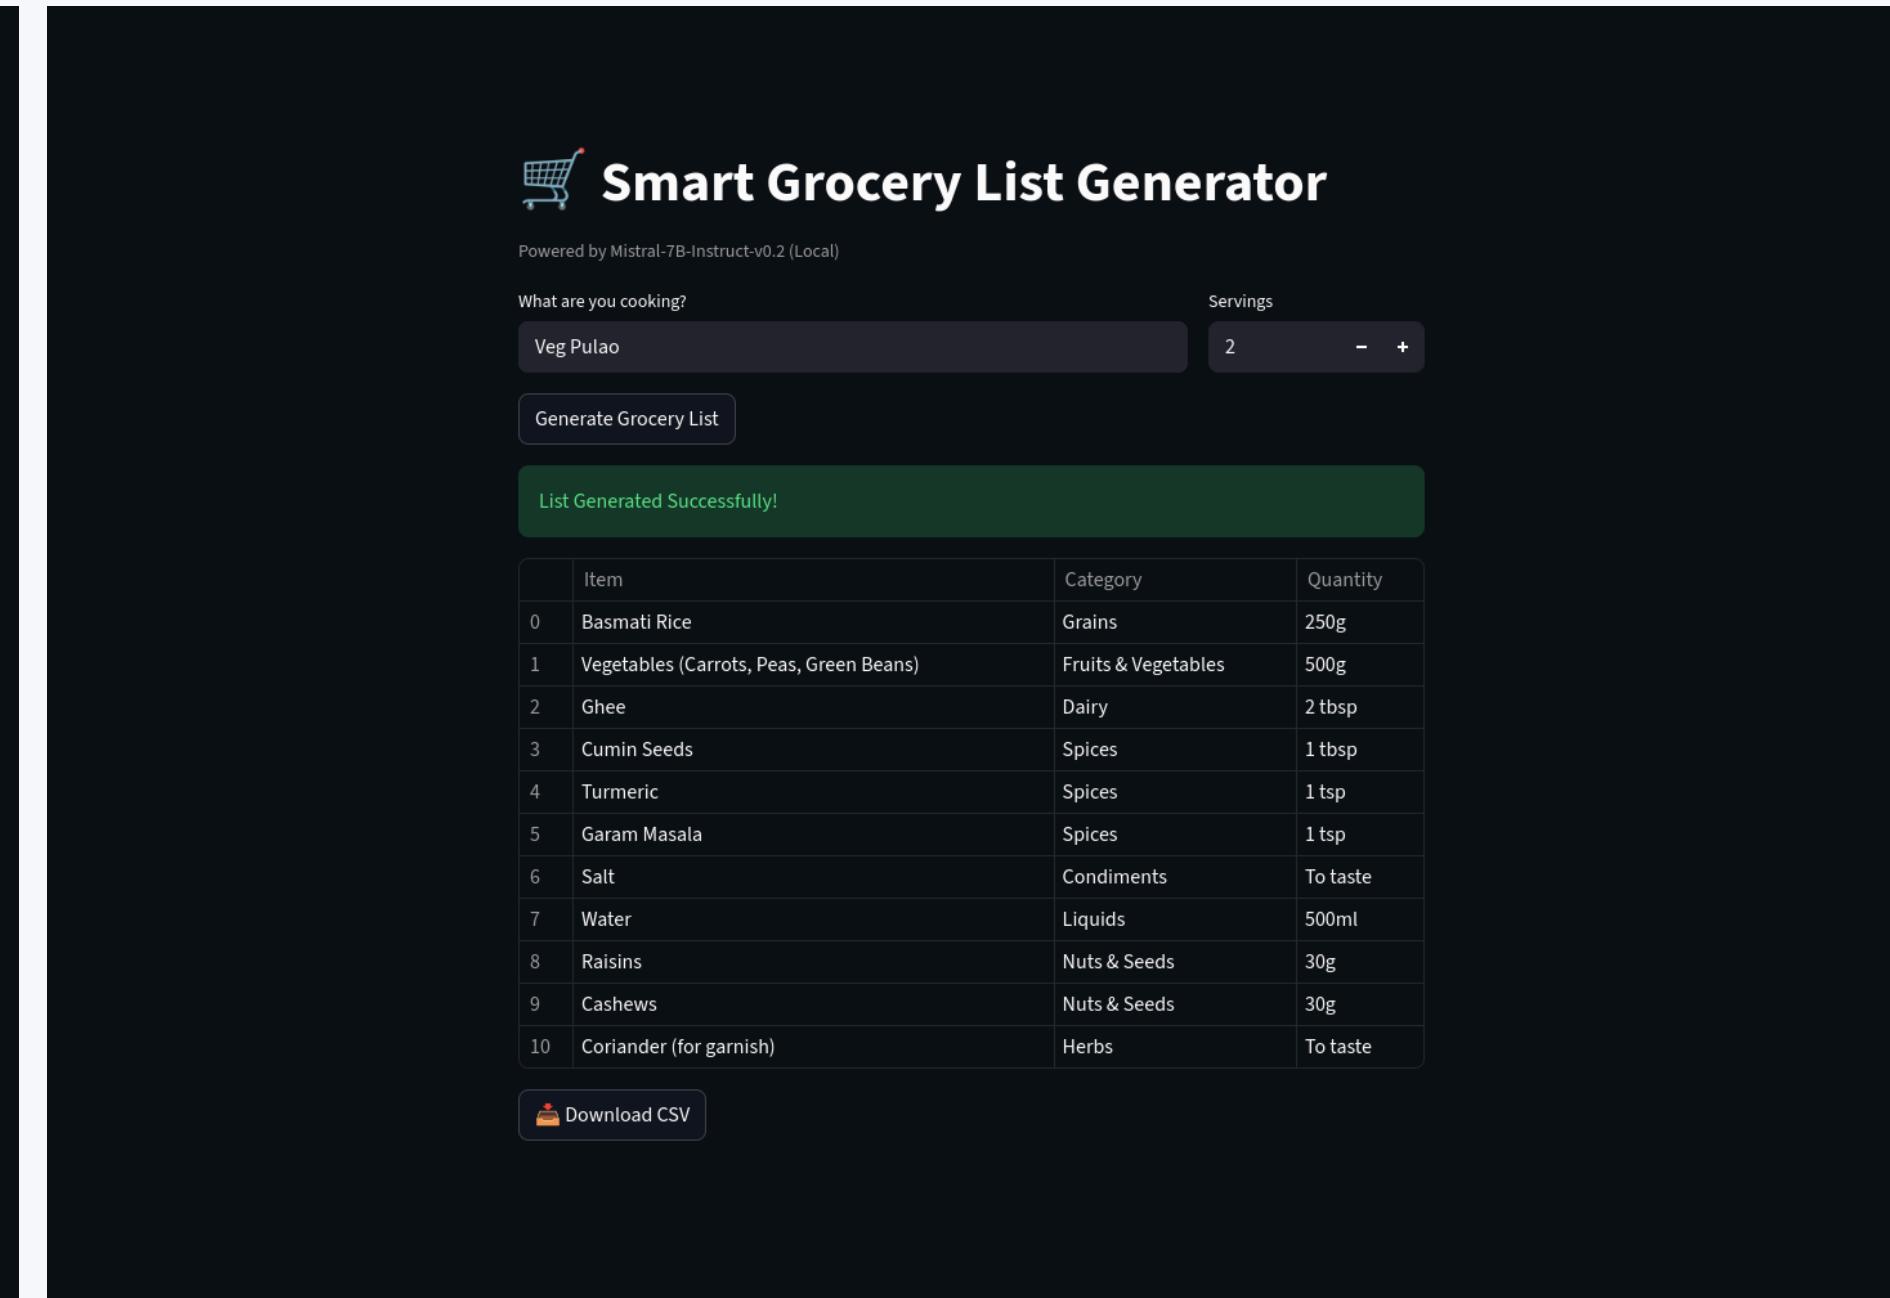

## Performance:

- Generates lists in <30 seconds.
- Accurately scales quantities (e.g., 2 servings vs. 10 servings).

The screenshot shows the "Smart Grocery List Generator" interface. The title "Smart Grocery List Generator" is at the top left, followed by "Powered by Mistral-7B-Instruct-v0.2 (Local)". Below this, there are two input fields: "What are you cooking?" containing "Pasta" and "Servings" set to "2". A "Generate Grocery List" button is below these. A green success message "List Generated Successfully!" is displayed. The generated grocery list is a table with columns "Item", "Category", and "Quantity". The items listed are: 0 Pasta (Grains, 400g), 1 Tomatoes (Vegetables, 500g), 2 Olive Oil (Fats, 2 tbsp), 3 Garlic (Vegetables, 2 cloves), 4 Onion (Vegetables, 1 medium), 5 Salt (Seasoning, to taste), 6 Black Pepper (Seasoning, to taste), 7 Basil (Herbs, 1 bunch), 8 Water (Liquid, for cooking pasta), and 9 Grated Parmesan Cheese (Dairy, for serving (optional)). At the bottom is a "Download CSV" button.

	Item	Category	Quantity
0	Pasta	Grains	400g
1	Tomatoes	Vegetables	500g
2	Olive Oil	Fats	2 tbsp
3	Garlic	Vegetables	2 cloves
4	Onion	Vegetables	1 medium
5	Salt	Seasoning	to taste
6	Black Pepper	Seasoning	to taste
7	Basil	Herbs	1 bunch
8	Water	Liquid	for cooking pasta
9	Grated Parmesan Cheese	Dairy	for serving (optional)

The screenshot shows the "Smart Grocery List Generator" interface. The title "Smart Grocery List Generator" is at the top left, followed by "Powered by Mistral-7B-Instruct-v0.2 (Local)". Below this, there are two input fields: "What are you cooking?" containing "Veg Pulao" and "Servings" set to "2". A "Generate Grocery List" button is below these. A green success message "List Generated Successfully!" is displayed. The generated grocery list is a table with columns "Item", "Category", and "Quantity". The items listed are: 0 Basmati Rice (Grains, 250g), 1 Vegetables (Carrots, Peas, Green Beans) (Fruits & Vegetables, 500g), 2 Ghee (Dairy, 2 tbsp), 3 Cumin Seeds (Spices, 1 tbsp), 4 Turmeric (Spices, 1 tsp), 5 Garam Masala (Spices, 1 tsp), 6 Salt (Condiments, To taste), 7 Water (Liquids, 500ml), 8 Raisins (Nuts & Seeds, 30g), 9 Cashews (Nuts & Seeds, 30g), and 10 Coriander (for garnish) (Herbs, To taste). At the bottom is a "Download CSV" button.

	Item	Category	Quantity
0	Basmati Rice	Grains	250g
1	Vegetables (Carrots, Peas, Green Beans)	Fruits & Vegetables	500g
2	Ghee	Dairy	2 tbsp
3	Cumin Seeds	Spices	1 tbsp
4	Turmeric	Spices	1 tsp
5	Garam Masala	Spices	1 tsp
6	Salt	Condiments	To taste
7	Water	Liquids	500ml
8	Raisins	Nuts & Seeds	30g
9	Cashews	Nuts & Seeds	30g
10	Coriander (for garnish)	Herbs	To taste

# Future Scope

- Pantry Tracking: Check inventory before adding items.
- Price Estimation: Estimate bill using local store APIs.
- Voice Input: Speech-to-text for hands-free use.
- Cloud Deployment for Efficiency: Move the heavy AI model to a cloud server (via Hugging Face API or AWS). This would reduce the user's app size from 4GB to <50MB and allow it to run on any low-end device or mobile phone instantly.

# Conclusion

- We successfully bridged the gap between Generative AI and Daily Utility.
- Successfully prototyped a Generative AI application using local hardware, proving that privacy-centric AI is possible.
- Established a clear migration path from a secure local prototype to a scalable cloud-based product for mass adoption.
